2018 US ZEB Conference

Understanding Electricity Pricing for Your Charging Strategy

Robert Thomas
Pricing Design Manager
September 11, 2018
Electricity Pricing: Time of Use & Demand Charges

• SCE’s commercial & industrial customers are served on rates with:
  – Time-of-Use (TOU) volumetric energy pricing;
  – Time-of-Use (TOU) demand charges; and
  – Non-time-related demand charges.

• The most important element in determining the cost of electricity for electric vehicle charging is the charging load profile
  – The more consistent (i.e., frequent and steady) the load profile, the higher the load factor and the lower the average rate
  – Consistent load profiles lead to spreading fixed costs (typically recovered from demand charges) over a greater amount of usage

• SCE plans to change its TOU periods in 2019*
  – Shifts Summer “on-peak” period from 12-6pm to 4-9pm weekdays
  – Winter weekdays and all weekends also have higher costs from 4-9pm
  – Introduces year-round weekend and winter weekday “super-off-peak” period (8am-4pm)

• Due to the unique nature of commercial EV charging load, SCE designed several rates exclusively for EV charging

* As adopted in CPUC Decision (D.)18-07-006.
SCE’s New TOU Periods and EV Rates

New TOU Periods to Reflect CA’s Changing Energy Market

EV Rates1/ to Support Expansion of Electric Transportation

Program economics benefit when load factor increases over the demand charge phase-in period

Year 1 – Year 5
Energy only; No Demand Charges

Year 6 – Year 10
Phase-in Demand Charges

Year 11+
Return to Energy + Demand Charges 2/

Favorable Pricing for EV Charging
- Rates w/ no or low demand charges
- Suited for lower load factor – infrequent & spikey – charging (e.g., in-depot charging).

Increased EV Adoption
- Rates w/ low demand charges + low energy charges (mid-day)
- Suited for hybrid charging strategies (e.g., combination of overnight in-depot + in-route opportunity charging)

Return to Cost Based Rates
- Rates w/ demand charges + low energy charges (mid-day)
- Suited for higher load factor – frequent & steady – charging (e.g., co-located in-depot charging)

SCE’s new TOU periods align price signal with grid friendly charging times and incentivize customers to optimize their charging patterns to minimize electricity costs.

1/ TOU-EV-7, TOU-EV-8, and TOU-EV-9 rates are applicable to commercial customers whose monthly max demand is 20 kW or less, 21 kW to 500 kW, and above 500 kW, respectively. Rates are available starting in 2019.

2/ The distribution grid component after the 10-yr period will reflect only ~55% (rather than 100%) of distribution costs, with the balance of distribution costs recovered through energy charges.
**Charge Ready Program**

SCE’s premier EV infrastructure program, where SCE is partnering with businesses, local governments, and community organizations to make electric vehicle charging easier and more convenient for all types of vehicles.

SCE installs, maintains and covers installation costs for charging infrastructure, while participants own, operate and maintain the charging stations. The program also provides rebates toward the purchase of charging stations.
